

## CLAIMS

What is claimed is:

1                   1. In a first computer, a method of printing an image, comprising:  
2                   (a) selecting a set of data to be accessed in response to a generic  
3                   access request;  
4                   (b) receiving content from an external device, the content  
5                   executable by a computer to cause a computer to generate a generic  
6                   access request to retrieve a set of data describing an image and further  
7                   executable to use the retrieved set of data to generate a printjob;  
8                   (c) executing the content so as to generate the generic access  
9                   requests;  
10                  (d) responding to the generic access requests by retrieving the  
11                  selected set of data; and  
12                  (e) executing the content so as to use the retrieved set of data to  
13                  generate the print job.

1                   2. A computer, comprising:  
2                   (a) means for selecting a set of data to be accessed in response to  
3                   a generic access request;  
4                   (b) means for receiving content from an external device, the  
5                   content executable by a computer to cause a computer to generate a  
6                   generic access request to retrieve a set of data describing an image and  
7                   further executable to use the retrieved set of data to generate a printjob;  
8                   (c) means for executing the content so as to generate the generic  
9                   access requests;  
10                  (d) means for responding to the generic access requests by  
11                  retrieving the selected set of data; and  
12                  (e) means for executing the content so as to use the retrieved set  
13                  of data to generate the print job.

1                   3. A program storage medium readable by a computer, tangibly  
2     embodying a program of instruction executable by the computer to perform  
3     method steps for printing a print job, the method steps comprising:  
4                   (a) selecting a set of data to be accessed in response to a generic  
5     access request;  
6                   (b) receiving content from an external device, the content  
7     executable by a computer to cause a computer to generate a generic  
8     access request to retrieve a set of data describing an image and further  
9     executable to use the retrieved set of data to generate a printjob;  
10                  (c) executing the content so as to generate the generic access  
11     requests;  
12                  (d) responding to the generic access requests by retrieving the  
13     selected set of data; and  
14                  (e) executing the content so as to use the retrieved set of data to  
15     generate the print job.
